                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     F.H. Collins and sequenced by The Institute for Genomic Research (TIGR). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from newly hatched first instar larvae to minimize the inclusion of DNA from microorganisms that inhabit the gut. The DNA is derived from mixed sexes of larvae. The BAC library was constructed at Texas A&W University BAC Center University, College Station, Texas 77843-2123, USA using a HindIII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This clone is from an A. gambiae BAC library (ND-TAM) provided by

  rpm) at room temperature. Culture was harvested, blended, incollated into minimal medium as above for 24 h. Cells were harvested, washed with water and inoculated into minimal medium base lacking nitrogen source for 6 h. Sequences were processed by phredPhrap 991019 and trimmed according to phd files and for vector seqs."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gibberella zeae

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruifily.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammosser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Prosophila DNA provided by the BDGP from the isogenic strain v2: cn bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or fillers for hybridization from the BACPAC Resource Center can be incention/Qualifiers

Davies and Jeffrey McDermott, combines cDNAs from CC-1690
cells grown to mid-log phase in TAP (NH4 - containing)
and shifted to TAP - NO3- (24hrs); H2 production
conditions (0, 12hr, 24hrs); H2 production
conditions (0, 12hr, 24hr); TAP + H3C2 (1, 12, 24 hr); TAP +
Sorbitol (1, 2, 6, 24 hr); TAP + Cd (1, 2, 6, 24 hr)
PolyA mRNA was purified from each sample, pooled and cDNA
synthesized 'The cDNA was directionally cloned into lambda
Zap II (Stratagene) in the EcoRI (5) and XhoRI (3)
sites: pBluescript II SK- plasmids were excised from the
lambda ZAP clones by superinfection with Exasist
(Stratagene) phage. The library was normalized using
method 4 described in Bonaldo et al., (1996) Genome
Research 6: 791-806."
                                                                                                                                                                                                                                                                                                                                 Chlamydomonas reinhardtii
Eukaryota; Viridiplantae; Chlorophyta; Chlorophyceae; Volvocales;
Chlamydomonadaceae; Chlamydomonas.
Chlamydomonadaceae; Chlamydomonas.

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

Determination of this BAC-end sequence was carried out as part of a collaboration of this BAC-end sequence was carried out as part of collaboration with the Berkeley Drosophila Genome Project (BDGP).
The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BAGs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC ilbrary was prepared by Kazutcyo Osocgawa and Aaron Mammoser in Fiteter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Encophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's and how to order individual BAC clones, the entire library and how to order individual BAC clones, the entire library or found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Shoemaker, R., Kein, P., Vodkin, L., Erpelding, J., Coryell, V., Khanna, A., Bolla, B., Marra, M., Hillier, L., Kucaba, T., Martin, J., Beck, C., Wylle, T., Underwood, K., Steptoe, M., Theising, B., Allen, M., Bowers, Y., Person, B., Swaller, T., Gibbons, M., Pape, D., Harvey, N., Schurk, R., Ritter, E., Kohn, S., Shin, T., Jackson, Y., Cardenas, M., McCann, R., Waterston, R. and Wilson, R.

//note="Vector: BBluescript II XR; Site_1: ECORI; Site_2: XhoI; The manA was isolated from roots of Glycine max 'Supernod' plants generously donated by Dr. Gary Stacey. The seedlings were innoculated with Bradyrhizoblum japonicus, strain USDA110 priot to harvest. Stratagene's cDNA synthesis Rit (catalog number 200401) was used to synthesize the CDNA. First-strand synthesis was performed with 5-methyl dTPP, hence the ligated CDNA was hemimethylated. A modification of Stratagene's first-strand synthesis primer was used. An 'anchor' nucleotide (V-A.C. or G) was added to the 3' end of the primer [GAGAGAGAGAGAGAACATAGTCTCGAG(T)18V] to anchor the primer at the 5' end of the poly(A) tract. After second-strand synthesis, the CDNA ends were filled in with cloned Pfu DNA polymerase, ligated to EconI adapters and subsequently phosphorylated. The XhoI site within the first-strand synthesis primer was then restricted by their hemimethylated status. The CDNA constructs were size-fractionated with a 500bp cutoff, using GibcobRL Life Technologies' CDNA size Fractionation Stratagene's spluescript II SR(+) that has been digested with EcoRI and XhoI, and phosporylated by Stratagene). Both the white end blue colonies appear to contain recombinant plasmids with cDNA inserts. hased on size of company.

Khoi; This CDNA library was constructed from mRNA isolated
from etiolated hypocotyl issue of 9-10 day old seedlings
of the cultivar Williams 82. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dr) primer with a Xhoi restriction site. EcoRI
adapters were ligated to the blunt-ended cDNA fragments
followed by digestion with ECORI and Xhoi The CDNA
fragments were directionally cloned into the ECORI
restriction site of the pBluescript vector. The ligated
cDNA fragments were transformed into DH10B host cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Email: est@watson.wustl.edu

/note="organ: pollen cone; Vector: Lambda TriplEx; Site_1: Sfil (A); Site_2: Sfil (B); Immature pollen cones were collected in the early spring, frozen and used for mkNa isolation. The SMART-PCR method (Clontech) was used to prepare a library from 1 ug total RNA, using the Lambda TriplEx vector. Plasmid subclones in prinplEx were recovered by cre-lox excision in E. coli strain BM25.8 and sequenced from the 5' end."

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).
                                                                                                                                          melanogaster BAC library was prepared by Kazutoyo Osogawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2: on bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    354 CATCCACAAAGAAGGGAATATTCAGGTCTGCGCAGCACTCAACGGCATCGTCAGTTGCGG 413

The present sequence is specific to enterohemorrhagic Escherichia coli (EHEC). The sequence is 99.9% homologous to the katp gene of E. coli 0157:H7 (nucleotides 407-1489 of the present sequence), and 95.8% homologous with IS91 of E. coli (nucleotides 1-406 of the present sequence). The present sequence is of plasmid origin. Fragments of the present sequence are used, as probes and primars, for detection of E. coli 0157:H7 and other enterohemorrhagic E. coli (EHEC), in human or animal samples, foods or the environment. The fragments are also useful Enterohemorrhagic Escherichía colí; EHEC; katP gene; E. coli 0157;H7; Nucleic acid sequence specific to enterohemorrhagic Escherichia coli, New nucleic acid containing sequences specific to enterohemorrhagic Escherichia coli, particularly serotype 0157:H7, used for detecting these bacteria in food Sequence 1489 BP; 386 A; 354 C; 391 G; 358 T; 0 other; (SNFI) PASTEUR SANOFI DIAGNOSTICS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          epoxidation or hydroxylation. The enzyme can also be used to detect or destroy hydrogen peroxide, e.g. in connection with glyoxylic acid production, blosensors, contact lens cleaning, pulp/paper bleaching and pasteurisation of dairy products. Antibodies raised against catalase-53CA1 can be used to screen libraries for detection and purification of cells containing the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is of the Microscilla furvescens catalase-53CA1 gene. Fragments of the gene can be used to identify related sequences. Catalase-53CA1 may be used to catalyse oxidation reactions such as epoxidation or hydroxylation. The enzyme can also be used to detect or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ATCGGACCCAAACGACCCGGATTTTGACTATGCCGAAGAGTTTAAGAAGCTAGATCTGGC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This partial DNA sequence encodes the katG gene of Mycobacterium tuberculosis strain H37Rv which is used in a novel method to rapidly identify strains of M. tuberculosis which are resistant to isoniazid (INH, isonicotinic acid hydrazide). The method involves the use of restriction fragment length polymorphism (RFLP) analysis to determine if a Ncil-MspI restriction site is absent in the DNA of the strain at the codon corresponding to codon 463 of a M. tuberculosis katG gene consensus sequence (see AAW31343). The absence of the site indicates a INH-resistant strain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TGAAAAAAGATATCAAAGATTTGCTGACAACTTCCCAGGATTGGTGCCCTGCGGATTATG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GCTCCAGTATTTCCTGGGGAGACCTGATGGTCCTGACTGGTAATGTTGCCCTTGAATCCA
                                                                                                                                                                   This DNA sequence comprises a consensus of the Mycobacterium tuberculosis wild-type katG (catalase-peroxidase) gene. Claimed methods of rapidly identifying strains of M. tuberculosis which are resistant to the tuberculostatic drug isoniazid (INH) are based on the discovery of 4 mutations in the wild-type gene sequence that confer INH resistance and which coincidently result in the addition or deletion of restriction endonuclease sites. Primers (see AAT90401-02) are provided for the PCR amplification of the katG gene of a test strain of M. tuberculosis, and further primers (see AAT90403-06) for uses in the restriction fragment length polymorphism analysis of the amplified gene, and hence for determination the susceptibility to INH of the strain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention realtes to a novel method of detecting Mycobacterium tuberculosis. The method comprises amplifying the DNA in the samples to generate a detectable amount of amplified DNA comprising a catalase-peroxide (katG) DNA fragment with sequence of bases 904-1523 of the M. tuberculosis strain H37kv MC katG gene sequence. The method optionally turther comprises determining if the katG DNA fragment has a serine to threonine mutation in codon 315 (S15T mutation), indicative of an isonicctinic acid hydrazide (IMR)-resistant M. tuberculosis strain. The method can be used to detect M. tuberculosis in biological fluids, especially human sputum, useful to diagnose tuberculosis. This disease is a major cause of human morbidity and mortality, and conclusive diagnosis and subsequent treatment depends on identification of the etiologic agent M. tuberculosis. INH has been used in tuberculosis treatment, but we may be a sequence of the method of the conclusive diagnosis.
